Airbnb Global Performance Analysis

Business report with recommendations

Prepared by Trishula Mitra, Data Analyst · November 2026 · Source: Airbnb listings dataset (Power BI model)

7,561	6,520	108	4.86	8,486
LISTINGS	HOSTS	COUNTRIES	AVG RATING	MEDIAN PRICE

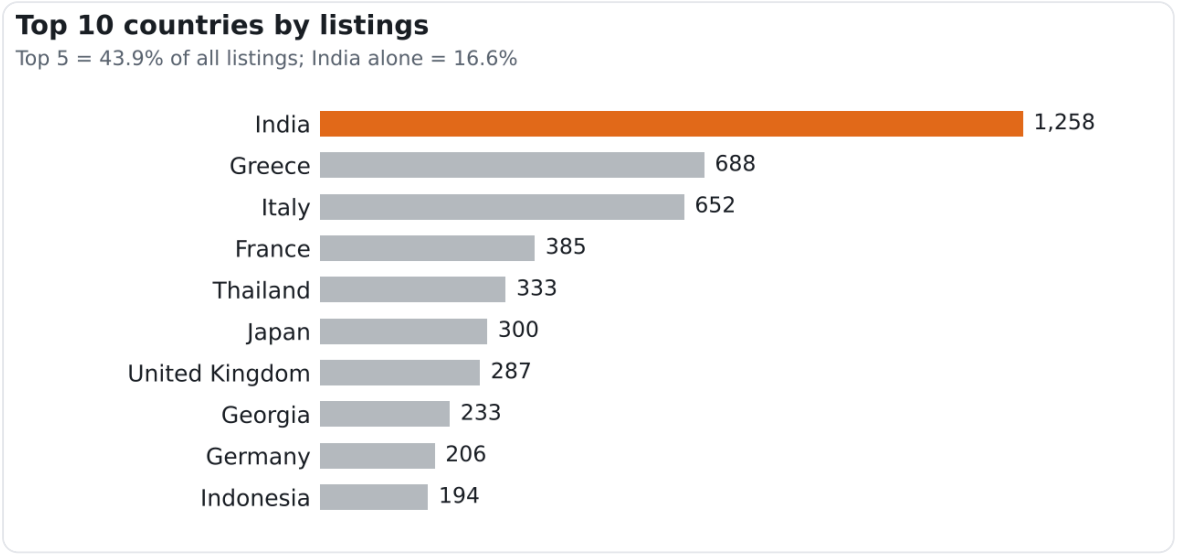

1. Executive summary

- **Supply is concentrated.** The top 5 countries hold 43.9% of listings (India 16.6%, Greece, Italy, France, Thailand).
- **Price does not buy quality.** Luxury listings cost 17.7x the budget tier but are rated only 0.05 points higher (4.89 vs 4.84); 71.6% of all listings score 4.8 or higher.
- **Value is geographic.** Cuba (value score 1.83), India (0.73) and Georgia (0.72) lead; the United States (0.16), Canada (0.17) and Israel (0.18) trail.
- **Lifestyle amenities carry the premium.** Hot tubs (+88%), pools (+78%) and water views (+60%) are linked to much higher median prices; Wifi and parking add little.
- **Hosts are small and fragmented.** 89.2% of hosts have one listing; the top 10 hosts hold 1.0% of supply.

> **Data note.** The source table holds one row per amenity (71,281 rows for 7,561 listings). All figures here use distinct listings. The dashboard's review totals need a DAX fix (see section 6).

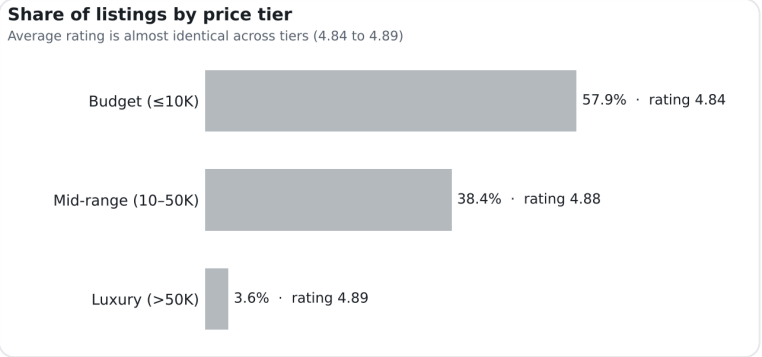

2. Market structure

Why it matters. Price is extremely skewed (skewness 20.6): the mean (13,868) is 63% above the median (8,486), with P90 at 28,529 and P99 at 91,341. Benchmarks should use the median.

Supply by country (listings). Volume markets (India, Georgia) and premium markets (Greece, Italy) are different businesses: India's median price is 3,994 vs 15,445 in Greece.

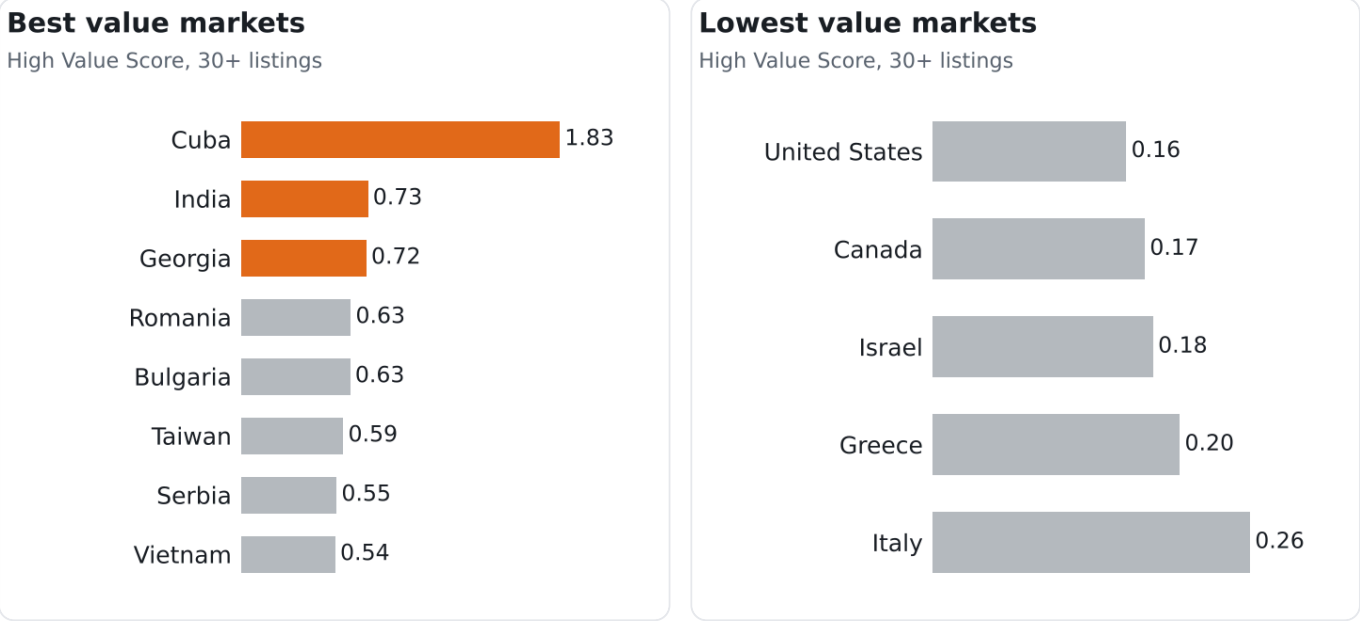

3. Price tiers and guest satisfaction

Budget up to 10K, Mid-range 10K to 50K, Luxury above 50K (native currency units).

Price and rating correlate weakly (Spearman rho = 0.19, p < 0.001; Kruskal-Wallis H = 190.4). The difference between tiers is statistically significant but small: price explains only about 3.5% of rating variation. With 71.6% of listings at 4.8+ and only 0.5% below 4.5, ratings are saturated and weak at separating quality.

4. Where the value is

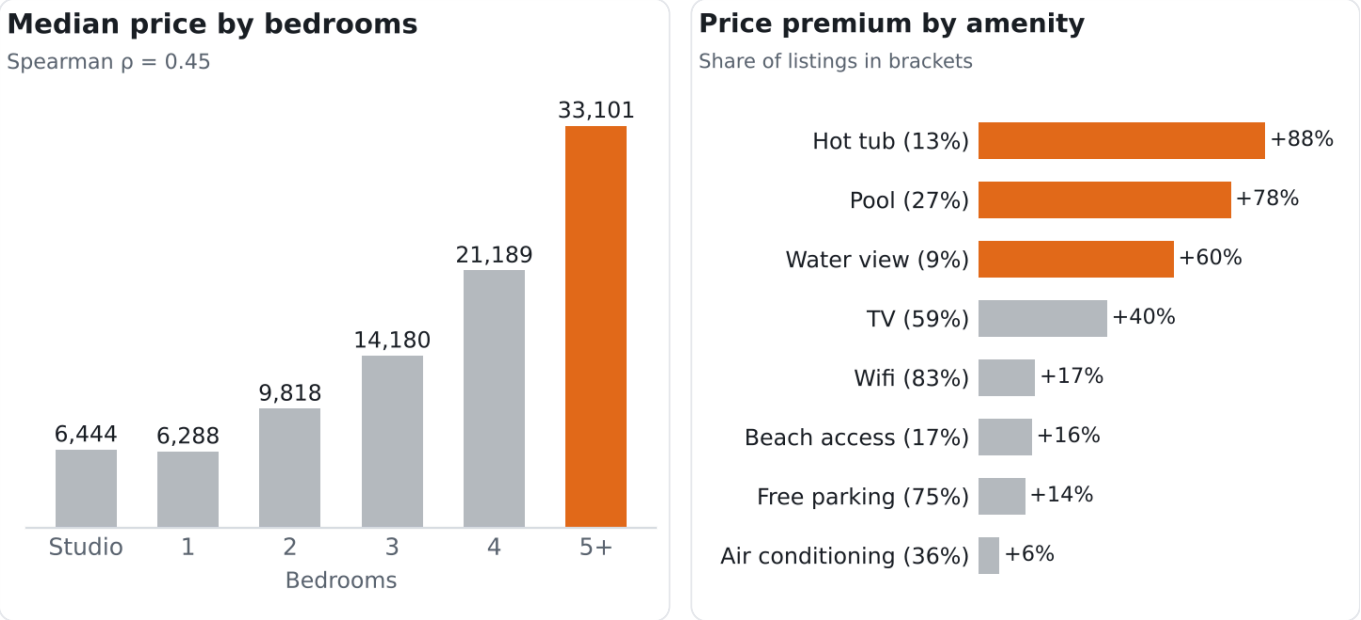

High Value Score = average rating / average price x 1000; markets with 30+ listings.

The gap between the priciest and cheapest market is 11.7x. Cuba's value score is 2.5x the next market.

Priciest markets	Avg price	Cheapest markets	Avg price
United States	30,977	Cuba	2,643
Canada	28,334	India	6,605
Israel	27,031	Georgia	6,755
Greece	24,061	Bulgaria	7,703

5. Property size and amenities

Left: median price by bedrooms. Right: median price premium for listings with vs without each amenity (all Mann-Whitney p < 0.01).

- Price grows with capacity (rho = 0.45), but median price per guest is flat at about 2,000 to 2,300 up to 4 bedrooms; 5+ bedrooms earn about a 19% per-guest premium.
- Pool (27% of listings), hot tub (13%) and water view (9%) show the largest premiums, yet these listings rate 4.85 to 4.87, in line with the overall 4.86. Amenities lift price, not rating.
- Premiums are associations: pools and hot tubs also cluster in larger homes and premium markets.

Hosts and engagement

Measure	Value
Single-listing hosts	89.2% of hosts
Multi-listing hosts (10.8%) hold	23.1% of listings; largest host has 10 listings; top 10 hosts = 1.0%
Median price: multi vs single	7,734 vs 8,671 (-11%)
Rating: multi vs single	4.844 vs 4.861 (significant, p < 0.001, but only 0.017 points)
Reviews per listing	Mean 55.4, median 28; top 20% of listings hold 62.2% of reviews
Reviews vs rating	Spearman rho = -0.19 (more-reviewed listings rate slightly lower)
UK vs India engagement	about 105 vs about 33 reviews per listing

6. Recommendations

#	Insight	Recommended action	KPI to track
1	Mean price is distorted by a luxury tail	Standardise on median price and median price per guest for benchmarks and host guidance	Median price per guest by market
2	Cuba, India, Georgia, Romania and Taiwan lead on value	Run value-led demand campaigns; recruit supply in small value markets (Romania, Bulgaria, Serbia)	Listings and bookings in value markets
3	Pool, hot tub and water view are linked to +60% to +88% median price	Coach hosts to showcase or add these features; validate the uplift with controlled pricing tests before promising returns	Price uplift in tests
4	Price per guest is flat up to 4 bedrooms	Give capacity-based price guidance (about 2,000 to 2,300 per guest)	Share of listings within guidance
5	71.6% of listings are rated 4.8+	Add finer quality signals (sub-ratings, review text) so ranking does not rely on stars alone	Rating spread, rank-quality correlation
6	US, Canada, Israel and Greece have the lowest value scores	Position as premium; test value messaging and bundles; watch for price-driven churn	Value score, conversion
7	89.2% single-listing hosts; multi-listing hosts hold 23.1% of listings	Build onboarding and tooling for small hosts; monitor quality on professional hosts	New-host activation, rating gap
8	Top 20% of listings hold 62.2% of reviews	Add review-request nudges to lift newer listings	Review share of newest listings
9	Rows repeat once per amenity in the data model	Split into Listings and Amenities tables; fix Total_Reviews, Average_Price and Average_rating with per-listing DAX	Reviews per listing = 55.4

7. Limitations and next steps

- **Dashboard issue:** Total_Reviews sums repeated amenity rows (3,924,642 shown vs 419,074 true), so Reviews per Listing shows 519 vs 55.4. Average price and rating are weighted by amenity rows (14,108 vs 13,868 per listing).
- No dates: seasonality, occupancy and revenue cannot be measured. Next step: add booking and calendar data.
- Currency is not labelled in the file; prices are in native units.
- Cleaning applied: trimmed country names; excluded 1 rating above 5 and 2 listings with no price from statistics.
- Findings are descriptive, not causal. Country rankings require 30+ listings.
